

Phase-2 Practice Project-Cucumber

Repository: https://github.com/Joshnitha/Phase2_Practice-Projects/

Create a Cucumber Framework for Amazon App.

Description

As a Full Stack Developer, you have to build an automation script and integrate it with Cucumber to implement BDD approach in the project.

Background of the problem statement:

As the project is in the final stage, management has asked you to automate the basic functionalities of Amazon for the internal employees. Also, you shall integrate it with Cucumber for easy development. This will help the development and DevOps team to work efficiently with the application.

You must use the following:

- Eclipse
- Selenium WebDriver
- Cucumber
- GitHub

SourceCode:

Feature file: Amazonpage.feature

@all

Feature: Test the amazon page on chrome Browser

@search @functional

Scenario: Test search mobile on amazon page

Given User is on the amazon page

Then click on moblies

Then click on moblies and accessories

Then click on apple

Then click on Product

And click on add to cartAdd

Step Definition : BaseAmazon – Base Class

```
package steps;

import org.openqa.selenium.WebDriver;

import org.openqa.selenium.chrome.ChromeDriver;

import io.cucumber.java.After;

import io.cucumber.java.AfterAll;

import io.cucumber.java.AfterStep;

import io.cucumber.java.Before;

import io.cucumber.java.BeforeAll;

import io.cucumber.java.BeforeStep;

public class BaseAmazon {

    @BeforeAll

    public static void featurestarts()

    {

        System.out.println("The feature has started execution");

    }

    @AfterAll

    public static void featureends()

    {

        System.out.println("The feature has completed execution");

    }

    public static WebDriver driver;

    @Before(order=0,value="@login and @functional") // this is cucumber hooks

    public void ConditionalHooks()

    {

        System.out.println("Task 1: Open the Chrome Browser");

    }

}
```

```

}

@Before(order=0,value="@login or @functional") // this is cucumber hooks

public void ConditionalHooks1()

{

    System.out.println("Task 1: Open the Chrome Browser");

}

@Before(order=0,value="not @login") // this is cucumber hooks

public void ConditionalHooks2()

{

    System.out.println("Task 1: Open the Chrome Browser");

}

@Before(order=0,value="@functional") // this is cucumber hooks

public void OpenBrowser()

{

    System.out.println("Task 1: Open the Chrome Browser");

    driver = new ChromeDriver();

}

// before every scenario in feature file these methods will run

@Before(order=1,value="@functional")

public void managebrowserwindow()

{

    System.out.println("Task 2: Manage browser window");

    driver.manage().deleteAllCookies();

    driver.manage().window().maximize();

}

// before every scenario in feature file these methods will run

```

```
@Before(order=2,value="@functional")

public void openUrl()

{

    System.out.println("Task 3: Enter URL");

    driver.get("https://www.amazon.in/");

}

// before every steps of a scenario this hook will run

@BeforeStep

public void stepstart()

{

    System.out.println("The steps has started execution");

}

// after every steps of a scenario this hook will run

@AfterStep

public void stepend()

{

    System.out.println("The steps has completed execution");

}

// these methods i want to run after every scenairo in my feature

@After(order=2,value="@functional")

public void capturetitle()

{

    System.out.println("Task 4: Capturetitle");

    System.out.println(driver.getTitle());

}

@After(order=1,value="@functional")

public void closebrowser()
```

```

        {

            System.out.println("Task 5: browser is now closed");

            driver.close();

        }

        @After(order=0,value="@functional")

        public void Testcompletemessage()

        {

            System.out.println("Task 6: Test scenario is now completed")

        }

    }

```

Step Definition : Amazonpage_steps

```

package steps;
